

California Conceptions Routine Labs

The following is a list of labs that are routinely ordered for patients undergoing treatment in our program. We must receive copies of the routine labs and any additional labs that may be required by our physicians. If you have completed these tests within the last 12 months, you can forward the results instead of repeating the tests.

Once you have established care with one of our physicians, we can provide you with a laboratory slip. If you would like to be proactive and get these tests ahead of time, please keep in mind our physician may require additional tests that aren't on this list, and you may have to have blood drawn again.

- PAP Smear and HPV testing (per recommended guidelines)
- Mammogram (if indicated by recommended screening guidelines)
- Infectious disease tests
 - HIV
 - Hepatitis B surface antigen (HBsAg not antibody)
 - Hepatitis C antibody
 - Syphilis - RPR or equivalent (VDRL, TPA)
- Health screening
 - Blood Typing, ABO and Blood Typing, Rh (D)
 - Anitbody screen, RBC
 - CBC with differential
 - TSH (thyroid stimulating hormone)
 - Prolactin
 - Rubella Immunity (IgG)

Other potential tests based on health history

- Hemoglobin A1C (HbA1C)
 - This may be ordered for obese patients or those at risk for gestational diabetes. An elevated HbA1C would require a delay in treatment to avoid health risks to pregnancy.
- Varicella titer if no previous history of varicella (chicken pox)

Please forward all results to: California Conceptions Donor Embryo Program
